What is electrochemical energy storage (EES) technology?

Electrochemical energy storage (EES) technology, as a new and clean energy technology that enhances the capacity of power systems to absorb electricity, has become a key area of focus for various countries. Under the impetus of policies, it is gradually being installed and used on a large scale.

What is the learning rate of China's electrochemical energy storage?

The learning rate of China's electrochemical energy storage is $13 \% (\pm 2 \%)$. The cost of China's electrochemical energy storage will be reduced rapidly. Annual installed capacity will reach a stable level of around 210GWh in 2035. The LCOS will be reached the most economical price point in 2027 optimistically.

Where will energy storage be deployed?

North America, China, and Europe will be the largest regions for energy storage deployment, with lithium-ion batteries being the fastest-growing technology and occupying approximately 75 % or more of the market share.

What are the two parts of energy storage system?

Combined with the working principle of the energy storage system, it can be divided into two parts [64,65], namely, the cost of energy storage and the cost of charging, where the cost of charging is related to the application scenario, geographical area, and energy type.

How much new energy storage will the NDRC have by 2025?

It has exceeded the target of installing 30GW (equivalent to 60GWh based on the 2C discharge rate, as shown in Table 1) or more of new energy storage by 2025, as proposed in the documents (Guidance on accelerating the development of new energy storage) by the NDRC and the NEA.
