Togo All-vanadium Liquid Flow Battery

Overview

Why are vanadium redox flow battery systems important?

Battery storage systems become increasingly more important to fulfil large demands in peaks of energy consumption due to the increasing supply of intermittent renewable energy. The vanadium redox flow battery systems are attracting attention because of scalability and robustness of these systems make them highly promising.

Are all-vanadium batteries a good choice for large-scale energy storage?

The all-vanadium battery is the most widely commercialised RFB used for large-scale energy storage. It has a low environmental impact with regard to the environmental polluting potential of vanadium 12, especially when compared to traditional lead-acid batteries 13.

Why does a vanadium electrolyte deteriorate a battery membrane?

Exposure of the polymeric membrane to the highly oxidative and acidic environment of the vanadium electrolyte can result in membrane deterioration. Furthermore, poor membrane selectivity towards vanadium permeability can lead to faster discharge times of the battery. These areas seek room for improvement to increase battery lifetime.

Can polymeric membranes be used in vanadium redox flow batteries (VRB)?

This review on the various approaches to prepare polymeric membranes for the application in Vanadium Redox Flow Batteries (VRB) reveals various factors which should be considered when developing new membranes materials with or without the addition of non-polymeric materials.

Which RFB batteries will be able to compete with all-vanadium batteries?

Past, present and potential future RFB competitors of the all-vanadium battery include iron/chromium (NASA) 14, bromine/polysulphide (Regenesys) 15, zinc/bromine (ZBB) 16, zinc/cerium (Plurion) 17, and soluble lead-acid

batteries (University of Southampton) 18.

How efficient is a vanadium electrolyte system?

For the vanadium system, developments are already underway in the P_{RoC} to reduce electrolyte costs 33 and electrode processes of RFBs have been improved to the point where system efficiencies of 70–80% can be expected at the kW- to MW-scales (Table 1).
